

# Supplier Capabilities Spotlight

## Flow Products, LLC

Flow Products, LLC has partnered with Rieger sanitary valves for North America. For more than 130 years Rieger gained experience in designing and manufacturing valves for many different applications in the food, beverage and pharmaceutical industries. Rieger, a member of the global NEUMO-Ehrenberg Group, is a family run company located in Southwest Germany. Rieger manufactures and supplies a full line of hygienic and aseptic process valves including shut off, double seal, mixproof, sampling, divert, control, filling, bypass and product recovery. Additional services offered include special constructions, valve manifolds, preventive maintenance and customer training.

In aseptic process engineering, process and quality control have become critical components. By means of the Biocheck sampling valve, samples can be taken from systems including vessels and piping in a simple and safe way. The most important features include aseptic compact

design, providing the ability for sterile sampling from hygienic production lines and ease of cleaning CIP/SIP without contamination. Two modes of operation: pneumatic actuation and manual control are combined into one valve permitting the flexibility depending on application requirements. The building block system by Rieger offers seamless change between pneumatic and manual actuation.

Rieger offers the first EHEDG certified combi sampling valve. The combi valve has the same advantages as the standard BioCheck Sampling Valve. In addition, the valve eliminates the requirement for an additional steam valve and prevents the product sample from back flowing into steam line.

Rieger's sanitary and aseptic valves are 3-A Certified while meeting ASME-BPE Standards and EHEDG Guidelines.
