Metal Detector Reduces False Rejects in Challenging Applications to Improve Profitability

Profile Advantage metal detectors offer a revolutionary breakthrough in sensitivity to maximize detection of contaminants in high moisture products of varying temperatures such as dairy. Systems are available for pumped or conveyORIZED product. Ferrous, non-ferrous, and stainless steel contaminants are easily detected with minimal false rejects, dramatically reducing product waste.

Profile Advantage incorporates advanced Condition Monitoring which assesses the performance and operation of key detector components and circuitry. Adverse trends or changes in performance that can potentially cause system downtime are signaled, giving operators advanced warning before a problem occurs. Systems are offered with customized material handling, nationwide service, and 24/7 telephone support and deliver brand protection, regulatory compliance, and improved profitability.

Send YOUR product to Tampa for testing and we will show you how small of a contaminant the Profile Advantage can find!
