Efficiency, Accuracy, and Profits

We see it all the time. Aging packaging equipment is costing food manufacturers time, efficiency, accuracy – and ultimately, profits. How is it impacting your business? First, let's start with some basic questions...

1. Are you running equipment that is more than twenty years old?
2. Is your current equipment running at less than your capacity?
3. What kind of impact could faster speeds create for your bottom line?
4. How much downtime do you typically experience in a quarter?
5. Have you had to add additional labor to your lines to meet increased production demands?
6. What percentage of scrap/loss do you have on average?

7. Is your current equipment built to meet current sanitary standards?

The reality is this. As much as it would cost you to invest in a new solution, it costs you more NOT to make that investment. In most cases, the cost of a new equipment solution quickly pays for itself. It then starts adding to your bottom line by merely offsetting the inefficiencies and risks associated with aging equipment. Increased speeds and efficiencies impact everything!

A new solution is not only an investment in today's manufacturing but also in tomorrow's growth and increased future revenue. It may be time to start a conversation about replacing a piece of equipment in your line, or at least assessing how much income

120-SRVO

a new machine could create. Contact our team at your convenience to start a conversation today.
